The Universal Aquatic System "UAS" was originally designed to help members of the paraplegic and quadriplegic community enjoy the water and safely take part in fun and therapeutic water activities.

There are many flotation devices out in the market today, however, many of these devices do not specifically service the disability community. The UAS was designed and created because there was a need for the patient, caregiver, and therapist. One of these necessities was keeping individuals upright even in turbulent waters.

Other factors were taken into account when creating the UAS include:

- ✓ Does the individual have a tracheotomy?
- ✓ Does the individual have contractures or difficulty with upper and lower body movements?
- ✓ Does the individual have hypertonic or hypotonic muscle tone?
- ✓ Does the individual have partial or full paralysis?
- ✓ Does the individual have adequate neck and trunk control?

Like pieces of a puzzle, features of the UAS were tailored to address each of these factors. The end-result is a flotation device that is designed to help members of the disability community enjoy, play, and have fun in the water. More importantly, the UAS is effectively built to help these individuals experience a better quality of life.

Why Choose UAS?

- ✓ Designed for paraplegics and quadriplegics
- ✓ Support and stabilize individuals to stay upright in calm or turbulent waters
- ✓ Made from commercial grade materials
- ✓ Can be used to assist with lifts and transfers
- ✓ Designed to assist first responders
- ✓ Aquatic, therapeutic, and recreational activities
- ✓ Physical rehabilitation
- ✓ Safe for individuals who are prone to seizures
- ✓ Creating a new relationship to being in the water
- ✓ Coast Guard certified (pending)
